

FIT COMPETITION 2026

FAKULTAS TEKNOLOGI INFORMASI
UNIVERSITAS KRISTEN SATYA WACANA

Welcome and Good Luck in the Preliminary Round of FIT Competition 2026, Data Science Participants!

To support the development of real-world solutions aligned with our main theme, **"Digital Impact for Humanitarian Response and Global Well-Being,"** the committee has released the official datasets that you must use to prepare your proposals and initial modeling for this round.

In this Preliminary Round, all provided datasets are in standard tabular formats (.csv or .xlsx). Each competition track is equipped with a dataset specifically chosen to represent real-world problems in the humanitarian sector. You are given full freedom to explore these datasets to produce profound, sharp, and solution-oriented analyses that align with your team's proposed ideas.

Please review the descriptions, formats, and download links corresponding to your team's competition track below:

Track I — Natural Hazard Impact [Natural Disaster]

Dataset Theme: Flood Prediction

- **Description:** This dataset encompasses various features that significantly impact flood occurrence and severity, covering both environmental and human influences. Participants will analyze a comprehensive set of factors, including *Monsoon Intensity, Topography Drainage, River Management, Deforestation, Urbanization, Climate Change, Dams Quality, Siltation, Agricultural Practices, and Encroachments*. Furthermore, it accounts for infrastructural and socio-political elements such as *Deteriorating Infrastructure, Inadequate Planning, Ineffective Disaster Preparedness, and Political Factors*. Your mission is to develop a robust machine learning model utilizing these diverse variables to accurately predict the target variable: **Flood Probability**. This predictive modeling is crucial for enhancing proactive disaster preparedness and minimizing collateral damage.
- **Publication Date:** February 18, 2025
- **Format:** .csv (Tabular)

Track II — Infrastructure and Energy/Power Failure [Energy]

Dataset Theme: Smart Grid Blockchain Transaction Dataset

- **Description:** The transition to Smart Grids brings new challenges in maintaining power distribution stability. This dataset records 2.8 million blockchain transaction simulations on a Peer-to-Peer (P2P) energy trading network, covering energy delivery, consumption, and complete blockchain metadata. Participants are challenged to analyze the stability

of smart energy infrastructure and detect anomalies in power distribution to prevent system operational failures or power outages in modern electrical grids

- **Publication Date:** January 20, 2026
- **Format:** .csv (Tabular)

Track III — Identity and Data Exploitation [Digital Security]

Dataset Theme: Phishing Detection Dataset

- **Description:** Digital identity theft often begins with data exploitation through fraudulent websites. This large-scale dataset contains 247,950 instances comprising legitimate and phishing URLs with 41 extracted technical features. The main focus is protecting digital identities. Participants must implement a machine learning classification algorithm to accurately differentiate between safe and malicious sites, establishing a foundation to block access to data-exploiting sites before identity theft occurs.
- **Publication Date:** June 7, 2023
- **Format:** .csv (Tabular)

Track IV — Human Health / Digital Health Intelligence [Health]

Dataset Theme: Tabular Dataset for AI-based Vector-Borne Disease Prediction

- **Description:** Vector-borne diseases remain a significant global threat. This dataset collects encrypted clinical information (to maintain patient privacy) from patients diagnosed with malaria, dengue fever, yellow fever, and typhus, encompassing 109 medical attributes. Participants can develop digital health intelligence models to predict infectious disease risks based on clinical symptoms, enabling much more effective and timely medical interventions.
- **Publication Date:** August 31, 2025
- **Format:** .csv (Tabular)

Track V — Supply Chain and Resource Scarcity [Food & Logistics]

Dataset Theme: Rice Supply Chain in West Java Province, Indonesia

- **Description:** Food security heavily relies on logistics efficiency. This operational dataset records the rice supply chain from five main actors (farmers, millers, middlemen, wholesalers, and retailers) across five regencies in West Java Province. Participants are challenged to analyze inefficiencies at each supply chain node and the environmental factors causing them. This is crucial for building logistics resilience strategies and preventing local staple food scarcity.

Official Dataset Download Directory (Mendeley Data)

Below is the centralized repository link to download all the official datasets used in this competition and to submit your team's deliverables (Technical Report):

<https://drive.google.com/drive/folders/10TCDyegYzo16edZDZ4t0Rfnd7OYfQBKe?usp=sharing>

Important Submission Notice

All teams are required to submit their deliverables using the same email account that was registered during the FIT Competition 2026 registration process. The committee will use the registered email address as the primary reference for participant verification and submission validation.

Before submitting, please ensure that all files, report formats, and submission requirements comply with the provisions stated in the official guidebook. Any submission made using an unregistered email account or not following the specified format may affect the verification process.

We wish all participants the very best throughout the Preliminary Round. Take this opportunity to showcase your analytical thinking, creativity, and problem-solving skills in developing innovative solutions that create meaningful digital impact for humanitarian response and global well-being.
